

The future of deep foundations, today

Mario A. Terceros H., Civil Eng. P.E.

President Executive, Expander Body International Inc.

Two new technologies for deep foundations and anchors will be presented. Both systems provide high quality information in the 100% of the elements installed. So is possible to reduce costs, save time and have a high quality control. The experience in both systems allows the optimization of piles,

caissons and anchors constructed with different construction methods. The flexibility of the systems allows to work in any type of soil and also in severely restricted areas, getting high service load and with the minimum carbon print in the market.
